

McIntosh Apple

Introduced in 1870 and went on to much fame and crossbreeding. McIntosh is the best-selling apple in the northeastern United States and in Canada. The apple has white, tender, crisp flesh that's spicy, highly aromatic and full of juice. The characteristic flavor carries over into sauce, but in a pie the slices lose their shape. Macs are the principal cider apple in the Northeast. Beware of McIntosh as winter wears on; if not stored well, the apples may turn mealy. Description and photo from UMass \$40 for 1 tree

Product Description

Liberty Apple

A prolific bearer that excels where McIntosh won't. Tree is low-maintenance due to its natural disease resistance to apple scab, cedar apple rust, fire blight, and powdery mildew. Fruit has a yellow background with attractive red overtones, a crisp white flesh, and a harmonious sweet-tart taste. Perfect for fresh eating, cooking, canning or keeping – proper storage improves the flavor! Originates from Geneva, New York in 1955. Cold-hardy. Ripens in September. A licensed variety of Cornell University. Pollinator required: Choose another apple variety. Description from Stark Bros. website, photograph from Fedco Trees \$40 for one tree

Product Description

Golden Delicious Apple

Golden Delicious began as a chance seedling, perhaps of Grimes Golden, on a farmer's hillside near Bomont, West Virginia. Golden Delicious is not related to the red variety of that name. This is a very easy apple to like. The skin is thin; the flesh, firm and crisp and juicy. Flavor and aroma are unmistakable, without being particularly assertive. Even the shape is somewhat agreeable: large, tall and conical. Golden Delicious strikes some cooks as too timid for the kitchen, but it can be used for pies and sauce with little or no sugar. Its distinctive aroma carries over into cider. Golden Delicious should store well if refrigerated but the skin will shrivel if kept at room temperature. Apple description taken from UMASS website; they attribute Apples by Roger Yepsen (c.1994, W.W. Norton & Company) \$40 for one tree

Product Description

Blue False Indigo (Baptisia australis)

Massachusetts Supplier! Atypical Farm brings us excellent quality 4" potted perennials for a third year. Native in US as far north and east as Pennsylvania. Perennial typically grows 3-4' tall and occurs in rich woods, thickets and along streambanks. Features purple, lupine-like flowers in erect racemes (to 12") atop flower spikes extending well above a foliage mound of clover-like, trifoliate, bluish-green leaves (leaflets to 2" long). Blooms in spring. Flowers give way to inflated seed pods (to 2.5" long) which turn charcoal black when ripe and have considerable ornamental interest. Seeds rattle around in the blackened pods which were once popularly used by children as rattles. Stems with seed pods are valued additions to dried flower arrangements. Easily grown in average, dry to medium, well-drained soil in full sun to part shade. Tolerates drought and poor soils. Over time, plants develop slowly expanding clumps with deep and extensive root systems. Trimming or shearing foliage after bloom helps maintain rounded plant appearance and obviates a possible need for staking, but eliminates the developing seed pods which are so attractive. \$24 for 3 pots

Product Description

Woodland Strawberry (Fragaria vesca)

Massachusetts Supplier! Atypical Farm brings us excellent quality 4" potted perennials for a third year. Compact, stemless, 4-8" tall plant that spreads indefinitely by runners that root as they go. Numerous, small, 5-petaled white flowers with yellow centers appear throughout summer. Tri-foliolate, coarsely-toothed, green leaves. Flowers are followed by edible, bright red strawberries (1/2" long) that may be harvested throughout summer. Flowers and fruit are usually simultaneously present on plants in summer.

Best grown in humusy, fertile, medium moisture, well-drained soil in full sun to part shade. Prefers full sun. Great ground cover/garden edge/lawn alternative. Will spread via runners and may self-seed if fruit is not harvested.

Product Description

Bloodroot (*Sanguinaria canadensis*)

Native white wildflower occurs in rich woods and along stream. Blooms early spring. Typically rises 6-10" tall and spreads over time in the wild to form large colonies on the forest floor. Each flower stalk emerges in spring wrapped by one palmate, deeply-scalloped, grayish-green, basal leaf.

Flowers open up in sun but close at night, and are very short-lived (1-2 days). Leaves continue to grow in size after bloom (sometimes to as much as 9" across) and remain attractive until mid to late summer when the plant goes dormant. All parts of the plant exude a bright reddish-orange sap when cut, hence the common name. Sap was once used by Native Americans for dyes. Roots are caustic and poisonous if ingested, but has been used medicinally for its antiseptic and emetic properties.

Best grown in moist, humusy, well-drained soils in part shade to full shade. Spreads over time, given space. \$18 for 3 bare root

Product Description

Black Eyed-Susan (*Rudbeckia hirta*)

A familiar and treasured native flower, highly adaptable to different soil types. Typically occurs in open woods, prairies, fields, roadsides and waste areas. Daisy-like flowers (to 3" across) with bright yellow to orange-yellow rays and domed, dark chocolate-brown center disks. Blooms throughout the summer atop stiff, leafy, upright stems growing 1-3' tall. Easily grown in average, medium moisture, well-drained soils in full sun. Best in moist, organically rich soils. Tolerates heat, drought and a wide range of soils except poorly-drained wet ones. Deadhead spent flowers to encourage additional bloom and/or to prevent any unwanted self-seeding-they will likely self-seed and will remain in the garden.

Mayapple (*Podophyllum peltatum*)

Also known as Mandrake. Rhizomatous, native wildflower occurring in both moist and dry woodlands. Grows 12-18" tall and features one or two, deeply-divided, palmately-lobed, umbrella-like, pale green leaves (to 12" diameter). Makes a stunning ground cover, but does die back in late summer. White flowers in early spring are showy, but usually hidden by the umbrella-like leaves. Each flower gives way to an edible, fleshy, greenish fruit (mayapple) which turn golden when ripe and may be used to make preserves and jellies. Leaves and roots are poisonous, however. Grow in average, medium moisture, well-drained soil in part shade to full shade. Prefers rich, moist, humusy, acidic soils. May form large colonies. Will self-seed under optimum growing conditions. Dies back in late summer. \$18 for 3 bare root

Threadleaf Bluestar (*Amsonia hubrichtii*)

Massachusetts Supplier! Atypical Farm brings us excellent quality 4" potted perennials for a third year.

Easily grown in average, medium, well-drained soil in full sun to part shade. Best fall foliage color usually occurs in full sun, but flowers generally last longer if given some afternoon shade in hot sun areas. Stems tend to open up and flop in too much shade, however. Consider cutting back the stems by about 6" after flowering to help keep stems upright and to shape plants into a nice foliage mound. \$24 for 3 plants

Product Description

Royal Fern (Osmunda regalis)

Tall, deciduous, native fern which usually occurs on moist bluffs and ledges and along streams, sometimes even growing in the water. Typically grows in clumps to 2-4' tall, but with constant moisture can reach 6' in height. Broad fronds have large, well-separated pinnae (leaflets) which give an almost pea-family appearance. Fronds typically turn yellow to brown in autumn. Spores are located in brown, tassel-like, fertile clusters at the tips of the fronds. Fun fact: Osmunda fiber used in the potting of orchids comes from the fibrous roots of these ferns.

Best grown in medium to wet soils in part shade. Prefers moist, rich, humusy, acidic soils, but adapts to lesser conditions.

Product Description

Northern Spy Apple

Northern Spy produces fairly late in the season (late October and beyond). Skin color is a green ground, flushed with red stripes where not shaded. The white flesh is juicy, crisp and mildly sweet with a rich, aromatic subacid flavor, noted for high vitamin C content. Its characteristic flavor is tarter than most popular varieties, and its flesh is harder or crunchier than most, with a thin skin. Northern Spy is commonly used for desserts and pies, as well as juice and cider. It is an excellent apple for storage, tending to last long due to late maturation. On semi-dwarf rootstock, will grow to ~15' tall. size: 4-6 feet tall, 1/2-3/4" caliper. \$40 for 1 tree

Wild geranium (Geranium maculatum)

Also called Spotted Geranium and Cranesbill ***special note: if you purchased these from us last year and did not have success, you may get a replacement order from our new supplier free of charge. Just leave us a note in the checkout.*** Showy, five-petaled flowers, color ranges from pink to white to lavender, occur at the top of leafy, 1-3 ft. stem. flowers are in loose clusters of 2-5 at the ends of branches above a pair of deeply 5-lobed leaves. Spring bloom. Deadheading will prolong bloom. It colonizes by thick rhizomes but is not aggressive. Native habitat is dry or moist woods; woodland edges; dappled meadows. Native range: Eastern US and Canada Grows in to partial sunlight, light shade. Prefers moist, rich, loamy soil with abundant organic matter. This plant also tolerates full sunlight if there is sufficient moisture in the soil. It is one of the easier woodland species to cultivate.

Special Value to Native Bees Special Value to Bumble Bees
Why is it called Cranes bill? Each seed is packed into a pod and the pods are attached to a structure that resembles a crane's bill. As the bill dries, it literally catapults the seeds away from the parent plant. Each seed has a small tail-like structure attached to it that bends and moves in response to changes in humidity, which helps to drive the seed into the soil where it can safely germinate. \$18 for 3 bare root plants

Witch-Hazel (*Hamamelis virginiana*)

Also called Common Witch-hazel, Winterbloom, Snapping Hazelnut, Striped Alder, Spotted Alder, Tobacco-wood, Water-witch. A small understory tree, it is often multi-trunked, spreading branches form an irregular, open crown. Grows 10-15' tall but can reach 35 ft. in height. New leaves emerge reddish-bronze in the spring, and turn a brilliant gold in the fall. Witch Hazel is best known for its fringed yellow flowers which appear in late fall and stay on the branches long after the leaves have dropped. The flowers are self-fertile and pollination is carried out by small flies and bees, along with several species of winter moths - which are active on cold nights. Bloom Time: October, November, December Performs best on moister sites; avoid extremely dry situations. Tolerates wet soils, pollution, shade, and poor soil. Full sun forms fuller, more symmetrical plants but may require more watering. The mature seeds open suddenly, with an audible popping sound, and are jettied as far as 30 feet from the mother tree. This seed dispersal can create an understory grove. Native range: Eastern and central US and Canada Native Habitat: Moist woods, thickets, bottomlands, floodplains. Full Sun, Partial Sun, Shade size: 18"-24" bare root \$15 for 3

Persimmon (*Diospyros virginiana*)

Also called Common Persimmon, Eastern Persimmon, Possumwood, Date Plum, Winter Plum, Jove's Fruit

Persimmon is slender tree, mature height 15' - 30', width 20' to 35'. The fragrant flowers, white to yellow flowers are hidden by half-grown leaves and attract honeybees. An edible deep orange persimmon ripens after several frosts. More than one tree is needed for pollination to produce fruit. Colony forming.

The word "persimmon" has an Algonquian origin; the genus name *Diospyros*, means "fruit of the god Zeus."

Large fruits attract wildlife.

size: 18-24" bare root

Pawpaw (*Asimina triloba*)

Also known as the Poor Man's Banana or Hoosier Banana.

A deciduous, cone-shaped tree. Grows 12' to 25' high and less broad. The dense, dangling foliage gives the Paw Paw a tropical appearance. The dark green leaves grow up to 12 inches in length. In March to May they produce maroon, upside down flowers that measure up to 2 inches across.

The large edible fruit is produced, which is oblong, light green in color, weighs 5 to 16 ounces and is 3 to 6 inches long. The fruit has a high amount of protein, minerals, amino acids and antioxidants. The inside has a creamy, custard texture. It contains black seeds are arranged in two rows and shaped like lima beans, with a length of 1/2 to 1 1/2 inches long. Its taste is described as a cross between a mango and a banana. Harvest time mid August to mid October. Should produce fruit in 5 to 6 years.

Grows best in full sun once established. Plant in deep, fertile soil that is well drained and slightly acidic. Deer and rabbit resistant. Wildlife food for foxes, raccoons and squirrels. Bees show no interest in Paw Paw flowers. Relatively disease free. Plant at least two trees for fruit production to ensure cross-pollination.

Pawpaw is native to southern and central US, as far east as western New York State, north into central Canada.

Native Habitat: Understory tree in Ditches, Ravines, Depressions, Flood plains, bottomland

Product Description

American Elderberry (Sambucus canadensis)

Also known as Common Elderberry, Black Elderberry, Mexican Elderberry, American Elder, Black Elder, Common Elder, Elderberry, Tapiro, Sauco, American Elderberry
Sambucus nigra ssp. canadensis A native thicket-forming shrub. Mature size 12' high, 6' wide with arching branches.

Elderberry flowers in June to July. Bees, wasps, and beetles are strongly attracted to the flowers. Fruits ripen in August to September and are eaten by many species of birds and mammals. Elderberries, though inedible when fresh and raw, are used for making jelly, preserves, pies, and wine. Does not tolerate drought. Native Range: across US, except northwest states; and eastern half of Canada. Native Habitat: moist, edge habitat, in full or light shade. Lake and pond shores, low areas along road ways, in low forest and old fields.

Provides Nesting Materials/Structure for Native Bees; Supports Co

Product Description

Tree Shelters

Brand name: Tubex standard Tree tube: 2 feet tall and PVC stake: 4 feet tall A tree shelter provides a micro-climate for trees to improve establishment and survival rates. Provides protection against animals and herbicides. Higher air moisture within the tree tubes reduces water stress and enables the plant to survive in dry or drought conditions.

Product specs:

- UV stabilised polypropylene, harmless to the environment
- Flared rim to minimize stem abrasion
- Pre-fitted releasable ratchet ties for ease of installation and maintenance
- Tubex Laserline - a line of laser generated perforations forming a controlled line of weakness along the shelter, designed to burst as the tree fills the shelter
- Built-in strengthening rods, which prevent ties tearing

- away from shelter in strong winds (unique to Tubex)
- Durable twin-wall construction for the best possible strength-to-weight ratio
- UV stabilized to provide a minimum estimated lifespan of 5-7 years (can vary beyond this range depending on site conditions)
- Comes as a nest of 5 with a diameter range of 2.8" – 4.13"

1/2" diameter PVC stakes have the flexibility to bend with the wind and deer rubbing and will return to their upright position. Trees allowed to sway in the wind will build stronger root systems than trees in tubes supported with rigid stakes. Will not rot. \$48 for set of 5 tree shelters and 5 stakes

Buttonbush

Also known as buttonball, button willow, riverbush. This Semi-aquatic native shrub is one of the latest to leaf out in spring. It has distinctive balls, or buttons, about the size of a gumball, of white to cream colored flowers that bloom in June. The flowers are fragrant and last about 1 month. Flowers are followed by seedheads that turn red and eventually dark brown. The seedheads last and provide winter interest. Grows 5'-12', tall, 4'-8' wide. Deer-resistant. Grows in full sun to partial sun. Grows in wet soils, even flooded conditions and standing water. Both nectar and pollen are important. Special value to honeybees, and native bees including bumblebees. Also attracts butterflies, insects, moths including Titan Sphinx, Hydrangea sphinx. Fruits are eaten by waterfowl, and birds. Native to eastern US and Canada, and Mexico. Scattered populations in southwestern US. size: 24-36" bare root \$25 for 5

Product Description

American Sweetgum (Liquidambar styraciflua)

Liquidambar styraciflua Also known as Sweetgum, American Sweetgum, Red Gum, White Gum, Star-leaved Gum, Starleaf Gum, Alligator Tree, Satin Walnut, Bilsted, Liquidambar Tall fast growing tree that gets 75 to 120 feet at maturity. Star shaped glossy green leaves that are aromatic when crushed.

Leaves turn yellow-purple-red in the fall. It has a sweet sap that has been used for many things including chewing gum. It is an earlier colonizer of open sites can be used for wind breaks; it is important tree for lumber, veneer and plywood industries. The tree has both male and female flowers, bloom time March, April and May. This tree has seed balls that are great for birds but problematic for people. Eastern goldfinches, purple finches, sparrows, mourning doves, northern bobwhites and wild turkeys eat the seeds. Small mammals such as chipmunks, red squirrels and gray squirrels also enjoy the fruits and seeds. The seed pods are spiny dark brown balls, and fall during the winter. They will require spring clean up if you mow or walk under the tree. Grows Full Sun, in swamps, at edges of wetlands and upland areas too, just cannot be in very dry locations. Known as a southern tree, the sweetgum is native to eastern and southeastern US from east TX to north Florida, to Missouri and north to Connecticut. It also grows in Central America in rainforests. Worcester County is just outside of the northern edge of its native range. It is hardy to Zone 5a. One of the reasons it can grow 14 -24 feet per year is because it is a nitrogen fixer. size: 24-36" bare root \$20 for 3

Butterflyweed (Asclepias tuberosa)

Massachusetts Supplier! Atypical Farm brings us excellent quality 4" potted perennials for a third year. Also known as Butterfly Milkweed, Pleurisy Root Milkweed of meadows and prairies, grows 1- 2.5 feet tall. It has umbels of orange flowers that bloom early summer to midsummer and sometimes again in late summer-autumn. One of few orange native flowers. These are also great a cut flowers. Grows in dry, sunny locations. Butterflyweed is native to eastern, midwestern and southern US and Quebec. Although widespread in Massachusetts is it rare and protected in our neighboring New England states. Like many other milkweeds this plant is a host for monarch butterflies. Special attention has been brought to the milkweeds because of their specialist association with the monarch butterfly caterpillars as part of efforts to protect monarch butterflies.

- For more information on monarch butterflies: [Monarchs and milkweed](#)

Soil Sampling

The first soil sample is \$50 with each additional soil sample costing \$35 each.

Each sample is prepared and mailed for analysis to Maine Soil Testing Service at the University of Maine in Orono. The standard soil test is the most economical way to check pH, organic matter, lead contamination, and all other essential nutrients. You will receive recommendations to adjust soil conditions and soil management practices to maximize growth and productivity tailored to your own growth goals and standards of practice. Once your purchase is made, our Conservation Planner will contact you to schedule an appointment to come out to your property. Site visits can also include other technical assistance such as plant identification, garden planning, and recommendations for invasive plant treatment. Our Conservation Planner will follow up by email with test results and further recommendations within 3 weeks of the visit. When making your purchase, please keep in mind that one sample can easily cover one lawn or garden area. You can also get results for different plant interests and concerns from one sample. For example, if you are interested in what your soil needs for your home garden and your perennial beds, that can be determined from one test. If your area is larger or has other concerns (like contamination) our planner may recommend multiple tests once seeing the location.

American Cranberry (*Viburnum trilobum*)

Also called *Viburnum opulus* var. *americanum*, Highbush Cranberry This is not a true cranberry or low bush cranberry (*Vaccinium macrocarpon*, in the Heath family), this American cranberry bush is one of the showiest of our native *Viburnums*. The American cranberry bush produces an edible fruit that is somewhat similar in taste, color and ripening time to cranberries, thus its confusing name. This shrub grows 8'-12' high with an equal spread. Showy, snow-white, lace-cap type flowers, are fragrant and bloom in mid to late May. Beginning in September, bright red fruits serve as food for birds and wildlife. Fall foliage color may be yellow, red, orange or burgundy is just one of the many attributes of this large and attractive native shrub. Prefers good, well-drained, moist soil and partial shade to full sun. Native Range: BC east to Newfoundland, south to Washington state and east to northern Virginia. Native Habitat: cool moist woodlands, streambanks in wooded areas, sandy swamps, soggy thickets, edges of sandy marshes, forested bogs, and roadside ditches Alternative to the similar European cranberry-bush (*Viburnum opulus*) which has become an invasive plant in some areas. Use Wildlife: Songbirds, gamebirds, small mammals. The berries are a winter-survival food because they remain on the branches above the snow. Attracts: Birds , Butterflies. Larval Host: Spring Azure size: 2'-3' bare root \$18 for 3 Photo Credits:
